

```
import heapq

class MyObject:

    def __init__(self, value, data):
        self.value = value
        self.data = data

    # Define the less than operator for comparison
    def __lt__(self, other):
        return self.value < other.value

    # Optional: Define other comparison operators if needed
    def __eq__(self, other):
        return self.value == other.value

    def __repr__(self):
        return f"MyObject(value={self.value}, data='{self.data}')"

# Create a heap (list)
my_heap = []

# Push custom objects into the heap
heapq.heappush(my_heap, MyObject(3, "third"))
heapq.heappush(my_heap, MyObject(1, "first"))
heapq.heappush(my_heap, MyObject(2, "second"))
```

```
# Pop elements from the heap
while my_heap:
    print(heapq.heappop(my_heap))
```

OUTPUT

```
MyObject(value=1, data='first')
MyObject(value=2, data='second')
MyObject(value=3, data='third')
```
